

STAX - SRS-4040

The SR-404 Signature headset with the cable lowest in capacity (such as the top model OMEGA II), producing increased high sound rendition especially for the high impedances of the electrostats. Part of the set is the SRM-006t, a Class A amplifier with low-noise dual FETs on the input and two tubes on the output. Switching is fully balanced with a quadruple precision potentiometer, but without inverters or transformers. This amplifier also has two inputs that can be switched over automatically onto the input printer circuit board via relay. One input is equipped with cinch sockets, the other one either with cinch or XLR sockets to provide a fully balanced signal path for balanced sources.

ORDER-NO.
