

## Headphone Breakout Box

---

[Click Here For Larger Size Picture](#)

Sometimes you won't have a separate amp channel available for every headphone you need to drive.

Our passive headphone breakout box divides a standard power amplifier output to feed 6 separate headphone outputs.

A resistor divider network protects your amp and helps compensate for differences in brands and models of headphones.

Multiple boxes can be daisy-chained together with Whirlwind ST Series cables if more outputs are needed.
