

PA-1 PERSONAL HEADPHONE MONITOR

The Whirlwind PA-1 is a high output, low distortion, portable monitoring device suitable for critical listening in any professional audio environment.

Use for:

- Headphone distribution systems.
- Sign language interpretation or language translation.
(The superior sound quality will reduce ear fatigue when working over extended periods of time.)
- Adding headphone monitoring to any piece of audio equipment.
- Boosting weak headphone outputs in high SPL environments.

The PA-1 accepts either balanced or unbalanced stereo, line level signals through parallel XLR and 1/4" TRS inputs.

A switch changes the input connector configuration from separate balanced inputs to combination unbalanced (Tip/Pin2 = Left, Ring/Pin3 = Right) for accepting signals from sources such as headphone jack outputs.

Powered by two 9 volt batteries that load into easy access drawers or with included external PS24 AC power supply.
